the properties of boundary value problems in \mathbb{R}^n . Given a problem for some pseudo-differential operator A with fixed boundary conditions in a domain $\Omega \subset \mathbb{R}^n$, the main idea for our analysis is to develop a suitable pseudo-differential calculus in which the given boundary value problem can be solved and its solution can be efficiently estimated.

- In a boundary-value problem, we have conditions set at two different locations
- A second-order ODE $d^2y/dx^2 = g(x, y, y')$, needs two boundary conditions (BC) – Simplest are $y(0) = a$ and $y(L) = b$
- Mixed BC: $ady/dx + by = c$ at $x = 0, L$

came to the fore in the analysis of boundary value problems for the Dirac operator on a manifold with boundary, see [19, 1, 2, 3, 5]. The boundary conditions we consider are defined by pseudodifferential operators, frequently specialized to pseudodifferential projections. The common theme throughout is the reduction of a boundary value ...
