A prominent role for the functional paradigm is rare in computing programs. Introducing the idea is difficult, partly because so few programs use functional methods that qualified instructional staff, at both the faculty and graduate assistant level, are scarce. This paper outlines some ways to facilitate moving towards the use of the declarative paradigms early in the curriculum, presents ...

Functions don't evaluate their arguments. This means that programs can compose together very well, with the ability to write control constructs (such as if/else) just by writing normal functions. The purity of Haskell code makes it easy to fuse chains of functions together, allowing for performance benefits. Click to ...

Cambridge IGCSE. Computer Science (0478) Cambridge IGCSE Computer Science helps learners develop an interest in computational thinking and an understanding of the principles of problem-solving using computers. They apply this understanding to create computer-based solutions to problems using algorithms and a high-level programming language.

```
tick :: State Int Int
tick = do n <- Int
         plusOne n
         execState tick n
-- A contrived addition example. Works only with positive numbers:
plus :: Int -> Int -> Int
plus n x = execState (sequence $ replicate n tick) x
```

Members of Show can be presented as strings. All types covered so far except for functions are a part of Show. The most used function that deals with the Show typeclass is show. It takes a value whose type is a member of Show and presents it to us as a string. ghci> show 3 "3" ghci> show 5.334 "5.334" ghci> show True "True"
