The structural chemistry of boron is dominated by its small atomic size, and relatively high ionization energy. With only three valence electrons per boron atom, simple covalent bonding cannot fulfil the octet rule. Metallic bonding is the usual result among the heavier congeners of boron but this generally requires low ionization energies.

From 1922 to 1946, Gilbert N. Lewis, who was widely known for covalent bond, electron pair, Lewis structure and other seminal contributions, was nominated 41 times for Nobel Prize in Chemistry but never won. It has been speculated that while working in Walther Nernst's lab, Lewis apparently developed a lifelong enmity with Nernst.

Expatica is the international community's online home away from home.
