Fine-grained cohesive sediment is the primary vector for nutrient and contaminant redistribution through aquatic systems and is a critical indicator of land disturbance. A critical limitation of most existing sediment transport models is that they assume that the transport characteristics of fine sediment can be described using the same approaches that are used for coarse-grained non ...

21/1/2008 · Also, the RMSE value was improved by 35.82% and 49.84% compared to the best correlation presented by the researchers for estimating the viscosity of water-based nanofluid and ethylene glycol-based ...

A diffusion-limited damage mechanism of the solid electrolyte interphase (SEI) layer in secondary batteries is proposed and confirmed by a diffusion enhancement strategy. By applying an external parallel magnetic field in a discharging process, the rupture of the SEI layer is eliminated and the life and performance of batteries are largely ...

A renewable electricity generation technology harnesses a naturally existing energy flux, such as wind, sun, heat, or tides, and converts that flux to electricity. Natural phenomena have varying time constants, cycles, and energy densities. To tap these sources of energy, renewable electricity generation technologies must be located where the natural energy flux occurs, unlike ...

14/5/2021 · 4. Bat coronaviruses (Bat-CoV) Bats are considered to be the major natural reservoir host of animal and human CoVs. Among the different bat species, the horseshoe bat belonging to the genus *Rhinolophus* is considered as the reservoir of SARS-like-CoVs (Watanabe et al. 2010). Several novel SARS-CoV-like coronaviruses are continuously being identified and ...

Asphalt binder characterization, fundamentals of asphalt rheology, asphalt materials behavior under loading and temperature effects. High-strength, lightweight, fiber-reinforced, and self-consolidating portland cement concretes, mix design, properties, advanced performance testing.
