This new book provides a unified, in-depth, readable introduction to the multipredictor regression methods most widely used in biostatistics: linear models for continuous outcomes, logistic models for binary outcomes, the Cox model for right-censored survival times, repeated-measures models for longitudinal and hierarchical outcomes, and generalized linear models for counts and other outcomes.

independent variables are forced into the regression equation. In sequential logistic regression the researcher determines the order in which the independent variables are entered into the model. In stepwise logistic regression, independent variables are included or excluded from the regression equation depending on statistical criteria. The results produce a number of models, or regression ...
