mixture) of a 2-stroke engine. (2) The exhaust pipe of a two-stroke engine attempts to harness the energy of the pressure waves from combustion. The diameter and length of the five main sections of a pipe are critical to producing the desired power band. The five sections of the pipe are the head pipe, diffuser cone (divergent), dwell or

any form of cooling. The resultant hot exhaust pipe had to be thoroughly insulated, but even so, it produced a tremendous amount of noise. However, reduction of exhaust gas temperature to about 40° or 50°C (104°F or 122°F ) can be achieved by injecting the engine cooling water into the exhaust line. This is how a “wet” exhaust system works.

An inherent drawback of IC engines is that it is a major source of noise pollution. That is why the reduction of exhaust noise from engines is, now-a-days, an important issue. Attaching a muffler in the exhaust pipe is the most effective means of reducing noise. ...
