The equalizer uses fully symmetrical non-interacting bands of a low noise design. This allows optimum equalization of the reverb effect. The parametric equalizer in the PRV-I may be used to equalize the line (dry) signal, the reverb signal, or both. This is an important advantage of the PRV-I. A sound system using the PRV-I not only gains a

A method is present for designing an equalization filter for a sound-reproduction system by adjusting the filter coefficients to minimize the sum of the squares of the errors between the equalized ...

to describe a process used to improve sound quality in loudspeaker systems. RMD™ offers a solution to a very fundamental problem. It has long been recognized that two different loudspeaker systems can sound different even though they both may be equalized to have the same frequency response. This difference is due to a vari-

of a sound system. In the literature, the work on robustness of equalization essentially falls into three categories. In the first category, the goal of filter design is a complete signal dereverberation at a

A method is provided for correcting errors in the overall reproduction characteristics of an audio system installed in a residence. The method may include the steps of generating a test signal as an input to the audio system and converting the resulting sound generated by the system and its room environment into stored data whose values are a function of the sound.
