Charlie Chong/ Fion Zhang f Projecting this examination, let us observe the phase lag for the entire part thickness. The standard depth of penetration is 1 mm, the part thickness is 5 mm; therefore, the ratio X/δ equals 5. This produces a phase lag of 5 radians or approximately 287 degrees for the part thickness.

Faraday's law states that the emf induced in a wire is proportional to the rate of the flux through the loop. Mathematically, where N is the number of loops, $\Delta\Phi$ is the change of flux in time, Δt . The minus sign indicates the polarity of the induced emf. The preceding equation is easy to use when the flux is set up by an electromagnet.
