(iv) If  $a$  and  $b$  are two integers such that  $a > b$ , then  $a - b$  is always a positive integer. (v) The difference of two integers is an integer. (vi) Additive inverse of a negative integer is positive. (vii) Additive inverse of a positive integer is negative. (viii) Additive inverse of a negative integer is positive. Solution: (i) False. (ii) True.

Congruence. Given an integer  $n > 1$ , called a modulus, two integers are said to be congruent modulo  $n$ , if  $n$  is a divisor of their difference (i.e., if there is an integer  $k$  such that  $a - b = kn$ ). Congruence modulo  $n$  is a congruence relation, meaning that it is an equivalence relation that is compatible with the operations of addition, subtraction, and multiplication.

In a class of 80 students, 40 study Physics, 48 study Mathematics and 44 study Chemistry. 20 study Physics and Mathematics, 24 study Physics and Chemistry and 32 study only two of the three subjects. If every student studies at least one of the three subjects, find: (a) the number of students who study all the three subjects, (b) the number of students who study only Mathematics and Chemistry.

Addition (usually signified by the plus symbol  $+$ ) is one of the four basic operations of arithmetic, the other three being subtraction, multiplication and division. The addition of two whole numbers results in the total amount or sum of those values combined. The example in the adjacent image shows a combination of three apples and two apples, making a total of five apples.
