Time-dependent density-functional theory (TDDFT) describes the quantum dynamics of interacting electronic many-body systems formally exactly and in a practical and efficient manner. TDDFT has become the leading method for calculating excitation energies and optical properties of large molecules, with accuracies that rival traditional wave-function based methods, but at a fraction of the ...

This chapter deals with the fundamental existence theorems of time-dependent density-functional theory. The first section introduces some important quantum mechanical concepts of time-dependent many-body systems, such as the time-dependent Schrödinger equation, time evolution operators, the continuity equation, and local conservation laws. In the next section, the Runge-Gross theorem and the ...
