and a classification of each engine. Next, thermodynamic and performance analyses for ideal and real cycles are introduced. Turbojet engine was coinvented in the 1930s by British and German activities.

Modern Turbofan engines can deliver high thrust without the high fuel consumption as compared to a turbojet engine. By trading the energy in the high velocity exhaust stream for power to drive a fan, the turbofan engine can process large amounts of air which yields a higher thrust per amount of fuel used.
